### Important!! Care and Feeding of Pansies and Violas

The feed requirements of pansies and violas differ from warm-season flowers because pansies and violas are trying to grow and flourish during cold, wet weather. In cold, wet soils, the warm-season soil bacteria that normally make the conversion from ammoniacal and urea nitrogen in the fertilizers, to the ***nitrate form which pansies and violas prefer***, are dormant. Because of this dormancy, winter feeding of pansies and violas with ammoniacal and urea forms of fertilizer may result in little or no food actually being available to the plants and a toxic ammonia buildup as well.

While it's ok to use regular fertilizers in the early, warm part of fall, it's still best to avoid high levels of ammonia and urea because plants may be more likely to stretch and be more sensitive to frosts.

The formulations below contain predominantly nitrate-based nitrogen, which is readily available in winter soils and also promotes compact, sturdy growth when weather is warmer. The two downsides of nitrate fertilizers are: 1) they have no slow-release capability, so their effects are diluted by heavy rains or excess watering. Therefore, they have to be applied more often than slow-release formulations and 2) they tend to raise the pH in soils so pH may have to be monitored

Granular 10-2-18 (8.6% nitrate)

Water Soluble 15-2-20 (13% nitrate, 2% ammoniacal)

Water Soluble 17-5-17 (12% nitrate, 2% ammoniacal)
